Irishstown Bend Stabilization & Rehabilitation Project

Question: Are there any monitoring points still operational in terms of piezometers and inclinometer?

Answer: There are still points that are accessible and operational. The team shall not assume that is not the case when outlining scope of services. The Port Authority has not been actively monitoring these instruments since the Barr and Prevost study was completed and therefore there is no additional data. The engineer of record's scope shall include a comprehensive geotechnical study of the hillside incorporating the previous study and existing hillside instrumentation. The final stabilization and dewatering design shall be supported by the engineer of record's comprehensive investigation.
